

Exam II
Differential Equations
University of Massachusetts Lowell
Summer 2020

Joel Savitz

June 16, 2020

1. Solve the IVP:

Given:

$$y'' - 5y' - 6 = 0 \tag{1}$$

$$y(0) = 4 \wedge y'(0) = 3 \tag{2}$$

Guess that $y = e^{rx}$ for some $r \in \mathbb{R}$, then:

$$y' = re^{rx} \wedge y'' = r^2e^{rx} \tag{3}$$

$$r^2e^{rx} - 5re^{rx} - 6e^{rx} = 0 \text{ (apply (3) to (1))} \tag{4}$$

$$r^2 - 5r - 6 = 0 \text{ (divide by } e^{rx}) \tag{5}$$

$$(r - 6)(r + 1) = 0 \implies r \in \{-1, 6\} \tag{6}$$

$$(6) \implies y(x) = Ae^{-x} + Be^{6x} \tag{7}$$

$$(2) \wedge (7) \implies A + B = 4 \text{ (apply initial 1)} \tag{8}$$

$$(7) \implies \frac{dy}{dx} = -Ae^{-x} + 6Be^{6x} \text{ for some } A, B \in \mathbb{R} \tag{9}$$

$$(2) \wedge (9) \implies -A + 6B = 3 \text{ (apply initial 2)} \tag{10}$$

$$\left(\begin{bmatrix} 1 & 1 & 4 \\ -1 & 6 & 3 \end{bmatrix} \sim \begin{bmatrix} 1 & 0 & 3 \\ 0 & 1 & 1 \end{bmatrix} \right) \iff (A = 3 \wedge B = 1) \tag{11}$$

$$\therefore y(x) = 3e^{-x} + e^{6x} \tag{12}$$

3	12

Table 1: The rate of change of the dependent variable at different values

2. Find and categorize the equilibrium solutions of the ODE

Given:

$$\frac{dy}{dx} = y(y-1)^2 \quad (13)$$

Let $f(y) = \frac{dx}{dy}$, then table 1 describes a few inputs and outputs to f .

We see that f is decreasing at values approaching $y = 0$ from the negative side and increasing at values approaching $y = 0$ from the positive side, so we say that the equilibrium solution $y = 0$ is unstable.

We also see that f is increasing at values approaching $y = 1$ from both sides, so we say that the equilibrium solution $y = 1$ is semi-stable.

3. Find the general solution

Given:

$$y = x^r \text{ for some } r \in \mathbb{R} \quad (14)$$

$$xy'' - 6y' = 0 \quad (15)$$

We can use this information to find the general solution:

$$y' = rx^{r-1} \wedge y'' = (r^2 - r)x^{r-2} \quad (16)$$

$$(15) \wedge (16) \implies (r^2 - r)x^{r-1} - 6rx^{r-1} = 0 \quad (17)$$

$$r^2 - 7r = r(r - 7) = 0 \text{ (divide by } x^{r-1}) \quad (18)$$

$$(18) \implies r \in \{0, 7\} \wedge y(x) = Ax^0 + Bx^7 \text{ for any } A, B \in \mathbb{R} \quad (19)$$

$$\therefore y(x) = A + Bx^7 \text{ for any real } A \text{ and } B \quad (20)$$

4. Population over time

Suppose we have a population of hamsters or something described by the following equations, where 2010 is considered to be the beginning of time.

$$\frac{dP}{dt} = AP \text{ for some } A \in \mathbb{R} \quad (21)$$

$$P(0) = 100 \wedge P(2) = 400 \quad (22)$$

We see that equation 22 is seperable and so we proceed to solve for the population in 2015, or in other words at $t = 5$.

$$(21) \iff \frac{1}{P} \frac{dP}{dt} = A \iff \int \frac{1}{P} dP = \int A dt \quad (23)$$

$$(23) \iff \ln P = At + B \text{ for some } B \in \mathbb{R} \quad (24)$$

$$(24) \iff P(t) = Ce^{At} \text{ for } C = e^B \quad (25)$$

$$P(0) = 100 \iff C = 100 \quad (26)$$

$$P(t) = 100e^{At} \quad (27)$$

$$P(2) = 400 \iff 100e^{2A} = 400 \iff e^{2A} = 4 \iff A = \ln 2 \quad (28)$$

$$\therefore P(t) = 100 \cdot 2^t \wedge P(5) = 3200 \text{ hamsters or something} \quad (29)$$

Then, we will have 3200 gerbils in 2015 and the population will double every year thereafter until the entire universe is consumed by the gerbil population. Doomsday for gerbils. Or hamsters. Or humans.

5. Compute the general solution

Given:

$$y'' - 2y' + 5y = 0 \quad (30)$$

We guess that $y = e^{rx}$ for some $r \in \mathbb{C}$, then:

$$y' = re^{rx} \wedge y'' = r^2 e^{rx} \quad (31)$$

$$(30) \wedge (31) \iff r^2 e^{rx} - 2re^{rx} + 5e^{rx} = 0 \quad (32)$$

$$(32) \implies r^2 - 2r + 5 = 0 \implies r \in \{1 - 2i, 1 + 2i\} \quad (33)$$

$$y(x) = Ae^{1-2i} + Be^{1+2i} \text{ for some } A, B \in \mathbb{C} \quad (34)$$

$$e^{ix} = \cos(x) + i \sin(x) \iff (36) \quad (35)$$

$$(35) \iff y(x) = e^x \left((A + B) \cos(2x) + i(B - A) \sin(2x) \right) \quad (36)$$

$$\therefore y(x) = e^x \left(C \cos(2x) + D \sin(2x) \right) \text{ for } C = A + B \wedge D = i(B - A) \quad (37)$$

6. Determine the linear independence of given functions

Given:

$$f(x) = xe^x \quad (38)$$

$$g(x) = x^2 \quad (39)$$

We also have the following derivatives:

$$\frac{df}{dx} = e^x + xe^x \quad (40)$$

$$\frac{dg}{dx} = 2x \quad (41)$$

We use the Wronskian determinant to determine linear independence. Two functions f and g are linearly independent iff their Wronskian determinant $W(f, g) \neq \mathbf{0}$ where $\mathbf{0}$ is the zero function in the vector space of continuous and differentiable functions on some interval I .

We compute:

$$W(f, g) = \begin{vmatrix} xe^x & x^2 \\ e^x + xe^x & 2x \end{vmatrix} = 2x^2e^x - x^2e^x + x^3x^x \neq \mathbf{0} \quad (42)$$

We see that $W(f, g) \neq \mathbf{0}$ so we conclude that f and g are linearly independent.

7. Mass attached to a spring with a dampener

Suppose we have an $m = 2$ kg mass subject a dampening force with the coefficient $c = 14$ pulled away from a spring $\Delta x = -2$ meters at a force of $F = 48$ Newtons.

By Hooke's law, we have $F = -k\Delta x \iff 48 = 2k \iff k = 24$.

Free spring mass movement is described by the following equation where $x(t)$ is a function of the position of the mass relative the the equilibrium position of the spring with respect to time:

$$mx'' + cx' + kx = 0 \quad (43)$$

We are also given the follwing initial values:

$$x(0) = 2 \quad (44)$$

$$x'(0) = 3 \quad (45)$$

Now, we can plug in the above values to equation 43 and solve by guessing that $x(t) = e^{rt}$ for some real r :

$$2x'' + 14x' + 24x = 0 \quad (46)$$

$$2r^2e^{rt} + 14re^{rt} + 24e^{rt} = 0 \quad (47)$$

$$2r^2 + 14r + 24 = 0 \quad (48)$$

$$r^2 + 7r + 12 = (r + 3)(r + 4) = 0 \implies r \in \{-3, -4\} \quad (49)$$

$$x(t) = Ae^{-3t} + Be^{-4t} \text{ for some } A, B \in \mathbb{R} \quad (50)$$

$$x(0) = 2 \iff A + B = 2 \quad (51)$$

$$x'(t) = -3Ae^{-3t} - 4Be^{-3t} \quad (52)$$

$$x'(0) = 3 \iff -3A - 4B = 3 \quad (53)$$

$$\begin{bmatrix} 1 & 1 & 2 \\ -3 & -4 & 3 \end{bmatrix} \sim \begin{bmatrix} 1 & 1 & 2 \\ 0 & -1 & 9 \end{bmatrix} \sim \begin{bmatrix} 0 & 1 & 11 \\ 0 & -1 & 9 \end{bmatrix} \iff A = 11 \wedge B = -9 \quad (54)$$

$$\therefore x(t) = 11e^{-3t} - 9e^{-4t} \quad (55)$$

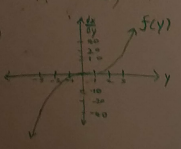

Appendix. Original scratch work

I
one

(1) $y'' - 5y' - 6y = 0$
 (2) $(y(0)=4) \wedge (y'(0)=3)$ } Given

(3) $r^2 e^{rx} - 5(r e^{rx}) - 6(e^{rx}) = 0$ Guess: $\exists r \in \mathbb{R} : y = e^{rx}$
 (4) $r^2 - 5r - 6 = 0$ Divide by e^{rx} (characteristic eqn)
 (5) $\left(\frac{5 \pm \sqrt{5^2 - 4(-6)}}{2} = \frac{5 \pm \sqrt{25+24}}{2} = \frac{5 \pm 7}{2} \right) \Rightarrow (r \in \{-1, 6\})$
 (6) $y = C_1 e^{6x} + C_2 e^{-x}$ for any $C_1, C_2 \in \mathbb{R}$
 (7) $y' = 6C_1 e^{6x} - C_2 e^{-x} \wedge y'' = 36C_1 e^{6x} + C_2 e^{-x}$
 (8) Verify that (6) holds: $(6C_1 e^{6x} + C_2 e^{-x}) - 5(6C_1 e^{6x} - C_2 e^{-x}) - 6(C_1 e^{6x} + C_2 e^{-x}) = 0$
 (9) $(36C_1 - 30C_1 - 6C_1)e^{6x} + (C_2 + 5C_2 - 6C_2)e^{-x} = 0$: TRUE
 (10) Apply (2) to (6): $6C_1 - C_2 = 3 \wedge C_1 + C_2 = 4$
 (11) $\begin{pmatrix} 6 & -1 \\ 1 & 1 \end{pmatrix} \begin{bmatrix} C_1 \\ C_2 \end{bmatrix} = \begin{bmatrix} 3 \\ 4 \end{bmatrix} \Rightarrow \begin{bmatrix} 6 & -1 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} C_1 \\ C_2 \end{bmatrix} = \begin{bmatrix} 3 \\ 4 \end{bmatrix} \Rightarrow (C_1 = 1 \wedge C_2 = 3)$
 (12) $\therefore y(x) = e^{6x} + 3e^{-x}$

II
two

(1) Suppose $\frac{dx}{dy} = y(y-1)^2 = f(y), y \in \{\mathbb{R} \rightarrow \mathbb{R}\}$
 (2) 

y	f(y)
-3	-48
-2	-18
-1	-4
0	0
1/3	8/27
1	0
2	2
3	12

 (3)

Equilibrium Solution	stability
near $y(x) = 0$	Unstable
near $y(x) = 1$	Semi-stable (Left)

III
three

(1) Suppose $(y = x^r) \wedge (xy'' - 6y' = 0)$
 (2) $y' = r x^{r-1} \wedge y'' = (r-1) r x^{r-2}$
 (3) Simplify (2): $y'' = (r^2 - r) x^{r-2}$
 (4) Apply (2), (3) to (1): $(r^2 - r) x^{r-1} - 6 r x^{r-1} = 0$
 (5) Divide (4) by x^{r-1} : $r(r-7) = 0$
 (6) (5) $\Rightarrow r \in \{0, 7\}$
 (7) $\therefore y(x) = C_1 + C_2 x^7$ for any $C_1, C_2 \in \mathbb{R}$

IV

four

- (1) Suppose $\frac{dP}{dt} = C_1 P$ for some $P: \mathbb{R} \rightarrow \mathbb{R}$ and some $C_1 \in \mathbb{R}$
- (2) And suppose $P(0) = 100 \wedge P(2) = 400$
- (3) $(1) \Leftrightarrow \left(\frac{dP}{dt} \frac{1}{P} = C_1 \right) \Leftrightarrow \left(\int \frac{1}{P} dP = \int C_1 dt \right)$
- (4) $(3) \Leftrightarrow (\ln P = C_1 t + C_2 \text{ for some } C_2)$
- (5) $(4) \Leftrightarrow (P = C_3 e^{C_1 t} \text{ for } C_3 = e^{C_2})$
- (6) $(P(0) = 100) \Leftrightarrow (C_3 e^{C_1 \cdot 0} = C_3 = 100)$
- (7) $(P(2) = 400) \Leftrightarrow (100 e^{2C_1} = 400) \Leftrightarrow (e^{2C_1} = 4)$
- (8) $(2C_1 = \ln 4) \Leftrightarrow (C_1 = \ln 2) \Leftrightarrow (P = 100 e^{\ln 2 t} = 100 \cdot 2^t)$
- (9) $\therefore P(5) = 100 \cdot 2^5 = 3200$ Gerbils in 2015
and the population doubles every year thereafter

V

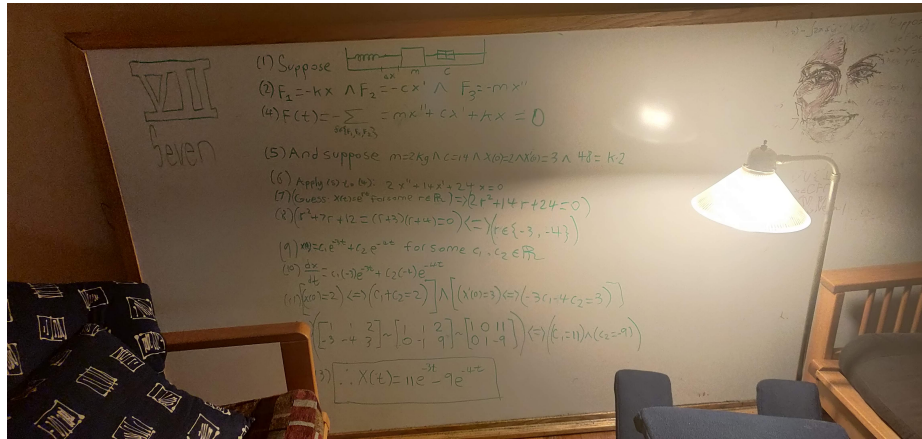

five

- (1) Suppose $y'' - 2y' + 5y = 0$
- (2) Guess: $y = e^{rx}$ for some $r \in \mathbb{C}$
- (3) Apply (2) to (1): $r^2 e^{rx} - 2r e^{rx} + 5e^{rx} = 0$
- (4) Divide (3) by e^{rx} : $r^2 - 2r + 5 = 0$
- (5) $\frac{2 \pm \sqrt{4-20}}{2} = 1 \pm \frac{1}{2} \sqrt{4-20} = 1 \pm 2i \Rightarrow (r \in \{1-2i, 1+2i\})$
- (6) $y = C_1 e^{(1-2i)x} + C_2 e^{(1+2i)x}$ for any $C_1, C_2 \in \mathbb{C}$
- (7) $\left(y = C_1 e^{(1-2i)x} + C_2 e^{(1+2i)x} \right) \wedge \left(e^{-i\theta} = \cos \theta + i \sin \theta \right) \Rightarrow y = C_1 e^x (\cos(2x) + i \sin(-2x)) + C_2 e^x (\cos(2x) + i \sin(2x))$
- (8) $(\sin \text{ is odd } \wedge \cos \text{ is even}) \Leftrightarrow (\sin(\theta) = \sin(\theta) \wedge \cos(-\theta) = \cos(\theta)) \Leftrightarrow y = (C_1 \cos(2x) - i C_2 \cos(2x) + i C_1 \sin(2x) + C_2 \sin(2x))$
for any $x \in \mathbb{C}$
- (9) $(8) \Leftrightarrow y = e^x (C_1 \cos(2x) - i C_2 \sin(2x) + i C_1 \sin(2x) + C_2 \cos(2x)) \Leftrightarrow y = e^x ((C_1 + C_2) \cos(2x) + i(C_2 - C_1) \sin(2x))$
- (10) $\therefore y(x) = e^x (C_3 \cos(2x) + C_4 \sin(2x))$ for $C_3 = C_1 + C_2 \wedge C_4 = C_2 - C_1$

VI

six

- (1) Suppose $f(x) = x e^x \wedge g(x) = x^2$
- (2) $\frac{df}{dx} = e^x + x e^x \wedge \frac{dg}{dx} = 2x$
- (3) $(1) \wedge (2) \Leftrightarrow (W(f, g) = \begin{vmatrix} x e^x & x^2 \\ e^x + x e^x & 2x \end{vmatrix})$
- (4) $(3) \Rightarrow (W(f, g) = 2x^2 e^x - x^2 e^x - x^3 e^x)$
- (5) $((4) \Rightarrow W(f, g) \neq 0) \Leftrightarrow (f \text{ and } g \text{ are linearly independent})$

Closing Remarks

This concludes my submission for Exam II. What did you think of the formatting?

The source code, the individual photos of my scratch work, and conversations about why everyone should typeset their work in \LaTeX are available on request.
